T cell lymphomas and Hodgkin lymphoma are the heterogeneous lymphomas in terms of their morphology, clinical behaviour, and prognosis and therapy response. Recent WHO fascicle on hematomalymphoid malignancies has introduced many new definite and provisional entities in T cell lymphomas. Gene expression profiling of T cell lymphomas helps in molecular characterization and classification of these lymphomas. However, pathologist faces diagnostic challenges to diagnose T cell lymphomas, Hodgkin's lymphomas and their mimickers. The mimickers range from benign lymphadenopathies to lymphomas, where it's difficult to accurately characterize them. Advances in molecular diagnostics can help to characterize these lymphomas; still they have the limitation in term of the interpretation and close correlation of the morphology with clinical picture. Considering these challenges, we are organizing this international lymphoma CME particularly focusing on the diagnostic challenges and recent advances in T cell lymphomas and Hodgkin lymphoma. We have invited prestigious national and international lymphoma pathologists and medical oncologists to share their experience.
